Notice

Use of the technologies described in this specification may infringe patents, copyrights or other intellectual property rights of FIPA Members and non-members. Nothing in this specification should be construed as granting permission to use any of the technologies described. Anyone planning to make use of technology covered by the intellectual property rights of others should first obtain permission from the holder(s) of the rights. FIPA strongly encourages anyone implementing any part of this specification to determine first whether part(s) sought to be implemented are covered by the intellectual property of others, and, if so, to obtain appropriate licenses or other permission from the holder(s) of such intellectual property prior to implementation. This specification is subject to change without notice. Neither FIPA nor any of its Members accept any responsibility whatsoever for damages or liability, direct or consequential, which may result from the use of this specification.

Foreword

- 22 The Foundation for Intelligent Physical Agents (FIPA) is an international organization that is dedicated to promoting the
- 23 industry of intelligent agents by openly developing specifications supporting interoperability among agents and agent-
- 24 based applications. This occurs through open collaboration among its member organizations, which are companies and
- 25 universities that are active in the field of agents. FIPA makes the results of its activities available to all interested parties
- and intends to contribute its results to the appropriate formal standards bodies where appropriate.
- 27 The members of FIPA are individually and collectively committed to open competition in the development of agent-
- 28 based applications, services and equipment. Membership in FIPA is open to any corporation and individual firm,
- 29 partnership, governmental body or international organization without restriction. In particular, members are not bound to
- 30 implement or use specific agent-based standards, recommendations and FIPA specifications by virtue of their
- 31 participation in FIPA.
- 32 The FIPA specifications are developed through direct involvement of the FIPA membership. The status of a
- 33 specification can be either Preliminary, Experimental, Standard, Deprecated or Obsolete. More detail about the process
- of specification may be found in the FIPA Document Policy [f-out-00000] and the FIPA Specifications Policy [f-out-
- 35 00003]. A complete overview of the FIPA specifications and their current status may be found on the FIPA Web site.
- 36 FIPA is a non-profit association registered in Geneva, Switzerland. As of June 2002, the 56 members of FIPA
- 37 represented many countries worldwide. Further information about FIPA as an organization, membership information,
- 38 FIPA specifications and upcoming meetings may be found on the FIPA Web site at http://www.fipa.org/.

1 Scope

51 52

53

54 55

56

This document deals with message transportation between inter-operating agents and also forms part of the FIPA Agent Management Specification [FIPA00023]. It contains specifications for:

• Syntactic representation of ACL in string form.

57

2 String ACL Representation

This section defines the message transport syntax for string representation which is expressed in standard EBNF format (see *Table 1*).

Grammar rule component	Example	
Terminal tokens are enclosed in double quotes	"("	
Non-terminals are written as capitalised identifiers	Expression	
Square brackets denote an optional construct	["," OptionalArg]	
Vertical bars denote an alternative between choices	Integer Float	
Asterisk denotes zero or more repetitions of the preceding expression	Digit*	
Plus denotes one or more repetitions of the preceding expression	Alpha+	
Parentheses are used to group expansions	(A B) *	
Productions are written with the non-terminal name on the left-hand side,	ANonTerminal = "terminal".	
expansion on the right-hand side and terminated by a full stop

```

2.3 Lexical Rules

116 117

118 119

120 121 Some slightly different rules apply for the generation of lexical tokens². Lexical tokens use the same notation as above, with the exceptions noted in Table 2.

Lexical rule component	Example
Square brackets enclose a character set	["a", "b", "c"]
Dash in a character set denotes a range	["a" - "z"]
Tilde denotes the complement of a character set if it is the first character	[~ "(", ")"]
Post-fix question-mark operator denotes that the preceding lexical	["0" - "9"] ? ["0" - "9"]
expression is optional (may appear zero or one times)	

Table 2: Lexical Rules

```
122
                                 = [\sim "\0x00" - "\0x20", "(", ")", "#", "0" - "9", "-", "@"]
[\sim "\0x00" - "\0x20", "(", ")"]*.
123
      Word
124
125
126
      String
                                 = StringLiteral | ByteLengthEncodedString.
127
                                 = "\"" ([ ~ "\"" ] | "\\\"")* "\"".
128
      StringLiteral
129
130
      ByteLengthEncodedString = "#" Digit+ "\"" <byte sequence>.
131
132
                                 = Integer | Float.
      Number

= Digit Digit.

2.4 Representation of Time

Time tokens are based on [ISO8601], with extension for relative time and millisecond durations. Time expressions may be absolute, or relative. Relative times are distinguished by the sign character + or – appearing as the first character in the token. If no type designator is given, the local time zone is then used. The type designator for UTC is the character z; UTC is preferred to prevent time zone ambiguities. Note that years must be encoded in four digits. As an example, 8:30 am on 15th April, 1996 local time would be encoded as:

19960415T083000000

The same time in UTC would be:

19960415T083000000Z

while one hour, 15 minutes and 35 milliseconds from now would be:

+0000000T011500035

2.5 Notes on the Grammar Rules

- 1. The standard definitions for integers and floating point are assumed.
- 2. All keywords are case-insensitive.
- 3. A length encoded string is a context sensitive lexical token. Its meaning is as follows: the message envelope of the token is everything from the leading # to the separator " (inclusive). Between the markers of the message envelope is a decimal number with at least one digit. This digit then determines that *exactly* that number of 8-bit bytes are to be consumed as part of the token, without restriction. It is a lexical error for less than that number of bytes to be available.

channel is able to faithfully transmit the chosen message encoding.

4. Note that not all implementations of the ACC (see [FIPA00067]) will support the transparent transmission of 8-bit

5. A well-formed message will obey the grammar, and in addition, will have at most one of each of the parameters. It

stated or implied the operational definitions of the values of parameters as these are further developed.

characters. It is the responsibility of the agent to ensure, by reference to internal API of the ACC, that a given

is an error to attempt to send a message which is not well formed. Further rules on well-formed messages may be

Strings encoded in accordance with [ISO2022] may contain characters which are otherwise not permitted in the

definition of Word. These characters are ESC (0x1B), SO (0x0E) and SI (0x0F). This is due to the complexity that

would result from including the full [ISO2022] grammar in the above EBNF description. Hence, despite the basic

description above, a word may contain any well-formed [ISO2022] encoded character, other (representations of)

parentheses, spaces, or the # character. Note that parentheses may legitimately occur as part of a well formed

escape sequence; the preceding restriction on characters in a word refers only to the encoded characters, not the
